

Apptivo Integrations

Integrations in Apptivo allows you to connect with more than 60+ apps directly and indirectly. Apptivo, by default, doesn't require as many integrations as our competitors because of its integrated suite of apps. For example, when other CRM competitors rely on third-party apps to generate invoices or run an email campaign, we support it directly within our Apptivo app. It's a one-stop shop for all your business needs.

But sometimes the best of the best fall through the crack and the feature you're looking for might not be available. In that case, we don't want to be the one to restrict your scalability. That's why we're continuing to enhance Apptivo by integrating with as many third-party apps as possible and opening our APIs for high-level integration.

As of this moment, we support the following third-party applications.

G Suite

Calendar, Task, Email, Contact Syncing & Document Sharing

Office 365

Calendar, Email Syncing & Document Sharing

piesync™

Sync your contacts 2-way in real time between Apptivo and your favorite cloud app from the 40+ apps

RingCentral®

Increase productivity by linking Apptivo CRM with RingCentral for a seamless powerhouse integration

Asterisk

Amplify your sales team's performance by recording the calls they make in the CRM app as well as in all other apps

fuse

Unify design, prototyping, and implementation of high quality mobile apps

Apination

Automate your routine tasks with simplicity & ease. Share data between applications with automatic workflow

The easiest way to save your business cards into Apptivo CRM

Dropbox

Keep everything organized without breaking your flow

zapier

Connect Your Apps and Automate Workflows with team members on an invite

slack

Create alignment & shared understanding across your teams

Payment Gateway

WordPress

API Integrations

Apptivo APIs are 100% customizable and can interact with any 3rd party application.

The Apptivo Developer APIs are HTTP-based programming interface that allows developers to interact with the Apptivo platform to extend and enhance its functionality. It is RESTful and uses JSON as the exchange format and supports read and write.

For every action you perform in Apptivo app's UI, our rest APIs are readily available. They are flexible and we don't put any sort of restrictions. Though we don't have all our APIs documented, you can access our APIs directly by inspecting the Network calls (Filter: XHR) when calling an API.

If that gets you confused, you can always touch base with us at support@apptivo.com and we'll get everything sorted in a jiffy. We'll be there for you like Dr.Watson was for Sherlock Holmes.

Note:

APIs are available only for Premium or Ultimate plan customers. Premium plan supports 2,000 requests/user/-day and Ultimate plan supports 20,000 requests/user/day.
